

Team 24 Project Charter

“Studious”

Team Members:

Aaron Carter, Jai Barath, Kevin Luo, Samuel Glover, Siddharth Sriram

Problem Statement:

Our app Studious aims to streamline studying and solve the issue of procrastination by organizing all your tasks into an easy-to-use interface with features such as a to-do list, calendar, and AI tools to create unique study plans for every class. While many similar apps already exist, such as Quizlet and Notion, most rely on individual planning and motivation, making them ineffective for students who struggle with procrastination. As such, Studious will include AI note taking and studying features that will allow students to focus more on applying the material, while also hosting a competitive environment that incentivizes studying across connected users based on each individuals' progress. This will differentiate Studious from other studying apps by streamlining and socializing the act of studying to keep students motivated.

Project Objectives:

1. Build an AI powered note taker that transcribes audio lectures into structured notes.
2. Organize workloads using a to-do list/calendar for assignments and unique study plans for each course. Each study plan will have its own interface and tasks.
3. Send out reminders via email to ensure users are aware of their tasks and deadlines. Users can choose when and how often to receive reminders (i.e. one week before, day of, etc.).
4. Implement a milestone system and progress tracker to keep users motivated on completing their tasks.
5. Build a leaderboard that allows users to view and compare their study progress with other users, encouraging consistent academic engagement.

Stakeholders:

Users: Students of all academic levels who need to manage heavy coursework, assignments, and study schedules. While mainly focused on students, other users can include a wide variety of individuals that are managing complex schedules across different academic, professional, and personal contexts.

Developers: Aaron Carter, Jai Barath, Kevin Luo, Samuel Glover, Siddharth Sriram

Project Manager: Yi Wu

Project Owners: Aaron Carter, Jai Barath, Kevin Luo, Samuel Glover, Siddharth Sriram

Project Deliverables:

- Develop a front end web interface using React that allows users to manage notes, organize schedules, track progress, and view goals/milestones.
- Use MongoDB to store and manage user accounts, schedules, to-do lists, study plans, and progress across sessions.
- Use a Node.js and Express backend for managing notes, tasks, schedules and reminders as well as integrate with speech to text.
- Use LocalAI API to transcribe audio into text and generate summarized, organized notes.
- Use LocalAI API to generate to-do list tasks from assignment summaries or syllabus.
- Implement a progress tracking system based on user objectives and completed to-do list tasks.
- Develop an email notification system triggered by backend logic to prevent users from procrastinating.
- Update users progress metrics to shared database collection to display in a real-time leaderboard that every user can view.
